

## New Horizon Technology SDSL Service

SDSL ( **Symmetrical Digital Subscriber Line**) is a technology that significantly increases the bandwidth and data transmission capacity of the copper wires most commonly used in data & voice communications today. It does this by using higher frequencies for data transfer than those used for a normal voice telephone call. SDSL connection speed can be as much as 50 times faster than today's standard analog modem connection.

New Horizon Technology SDSL is designed to allow businesses to share corporate network resources, enjoy the benefits of teleworking, and help small/home offices look and act big while meeting or exceeding traditional connectivity technologies like dial-up, ISDN, Frame Relay & T-1 lines.

### **SDSL Can...**

- Eliminate the hassles of dial-up and untimely disconnects
- Dramatically improve your reliability
- Increase your connection speed
- Significantly reduce your communications costs
- Greatly enhance your businesses productivity

With New Horizon Technology SDSL, data travels over our private network, not over the Internet. This means highly predictable performance - the speed you expect with the assurance that your data arrives where you need it, when you need it.
